

# Well-composed cell complexes

Rocio Gonzalez-Diaz  
Maria-Jose Jimenez  
Belen Medrano

# Motivation

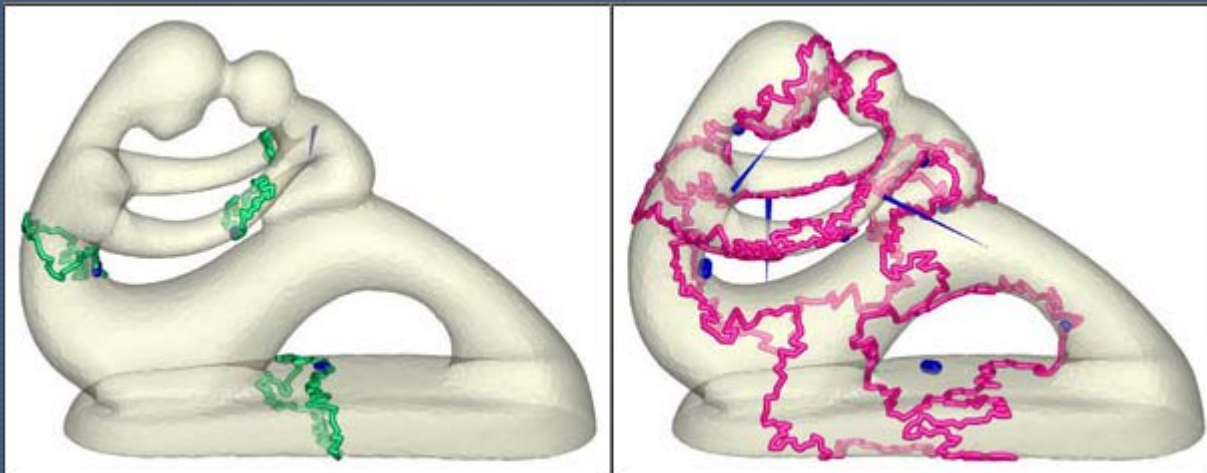

□ Our ultimate purpose:

To extract (co)homological information of a 3D model.

# Motivation

For this aim, first we need to compute representative (co)cycles of (co)homology generators of dimension 1 in the model.

Extracted from Dey et al., Computing Geometry-aware Handle and Tunnel Loops in 3D Models. ACM Transactions on Graphics, Vol. 27, No. 3, Article 45, (2008).

# Introduction

## □ *T. Dey et al:*

Computing loops on the surface that wraps around their 'handles' and 'tunnels'.

Applications:

- Feature detection
- Topological simplification
- ...

Dey T. K., Li K., Sun J.: On computing handle and tunnel loops. IEEE Proceedings of the international conference on cyberworlds; 2007.p.357-66.

# Introduction

---

- ❑ All the computations are carried out over a connected closed surface in  $\mathbb{R}^3$ .
- ❑ Can we start from a similar scenario if we consider the cubical complex associated to a 3D digital picture?

**Our answer: Well-composed cell complexes**

# Introduction

---

□ Well-composed images enjoy important topological and geometric properties:

1. There is only one type of connected component.
2. Some algorithms used in computer vision, computer graphics and image processing are simpler.

# Introduction

---

□ Well-composed images enjoy important topological and geometric properties:

3. Thinning algorithms can be simplified and naturally made parallel if the input image is well-composed.
4. Some algorithms for computing surface curvature or extracting adaptive triangulated surfaces assume that the input image is well-composed.

# Introduction

- There are several methods for turning binary digital images that are not well-composed into well-composed ones:

Original image

Well-composed

Differences in gray

...but these methods “destroy the topology”.

# Introduction

---

□ Our goal in this paper:

To “transform” the cubical complex induced by a 3D binary digital picture into a homotopy equivalent cell complex, whose boundary is made up by 2-manifolds:

WELL –COMPOSED CELL COMPLEX.

# 3D digital images:

- $I = (\mathbb{Z}^3, B)$ : set of unit cubes (*voxels*) centered at the points of  $B$  together with all the faces.
- Example:  $I = (\mathbb{Z}^3, B)$ ,  $B = \{(0,0,0), (0,1,0), (0,0,1), (1,0,1)\}$

$B = \textit{foreground}$

$B^c = \mathbb{Z}^3 \setminus B = \textit{background}$

# Cubical complex:

{ Voxels }  $\longleftrightarrow$  { 3D cubes in  $\mathbb{R}^3$  }

Combinatorial structure: **CUBICAL COMPLEX**

Voxel

- 0-cells = vertices
- 1-cells = edges
- 2-cells = squared faces
- 3-cells = cubes

# Cubical complex:

{ Voxels }  $\longleftrightarrow$  { 3D cubes in  $\mathbb{R}^3$  }

Combinatorial structure: **CUBICAL COMPLEX**

0-cells notation:

$$p_l = \left( i \pm \frac{1}{2}, j \pm \frac{1}{2}, k \pm \frac{1}{2} \right)$$

# Cubical complex:

{ Voxels }  $\longleftrightarrow$  { 3D cubes in  $\mathbb{R}^3$  }

Combinatorial structure: **CUBICAL COMPLEX**

1-cells notation:

$$a_l = (i, j \pm \frac{1}{2}, k \pm \frac{1}{2})$$

$$a_l = (i \pm \frac{1}{2}, j, k \pm \frac{1}{2})$$

$$a_l = (i \pm \frac{1}{2}, j \pm \frac{1}{2}, k)$$

# Cubical complex:

{ Voxels }  $\longleftrightarrow$  { 3D cubes in  $\mathbb{R}^3$  }

Combinatorial structure: **CUBICAL COMPLEX**

2-cells notation:

$$c_l = (i \pm \frac{1}{2}, j, k)$$

$$c_l = (i, j \pm \frac{1}{2}, k)$$

$$c_l = (i, j, k \pm \frac{1}{2})$$

# Cubical complex:

{ Voxels }  $\longleftrightarrow$  { 3D cubes in  $\mathbb{R}^3$  }

Combinatorial structure: **CUBICAL COMPLEX**

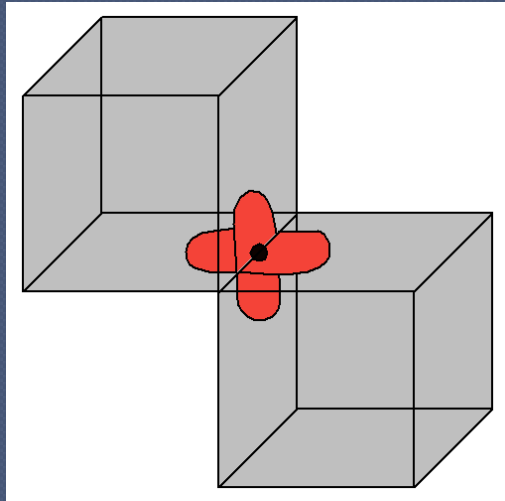

# Well-composed images:

- $I = (Z^3, B)$  is a **well-composed image** if the boundary of the cubical complex associated,  $\partial Q(I)$ , is a 2D-manifold.
- [Latecki97] A 3D binary digital image is well-composed iff the configurations  $C_1$ ,  $C_2$  and  $C_3$  do not occur in  $Q(I)$ .

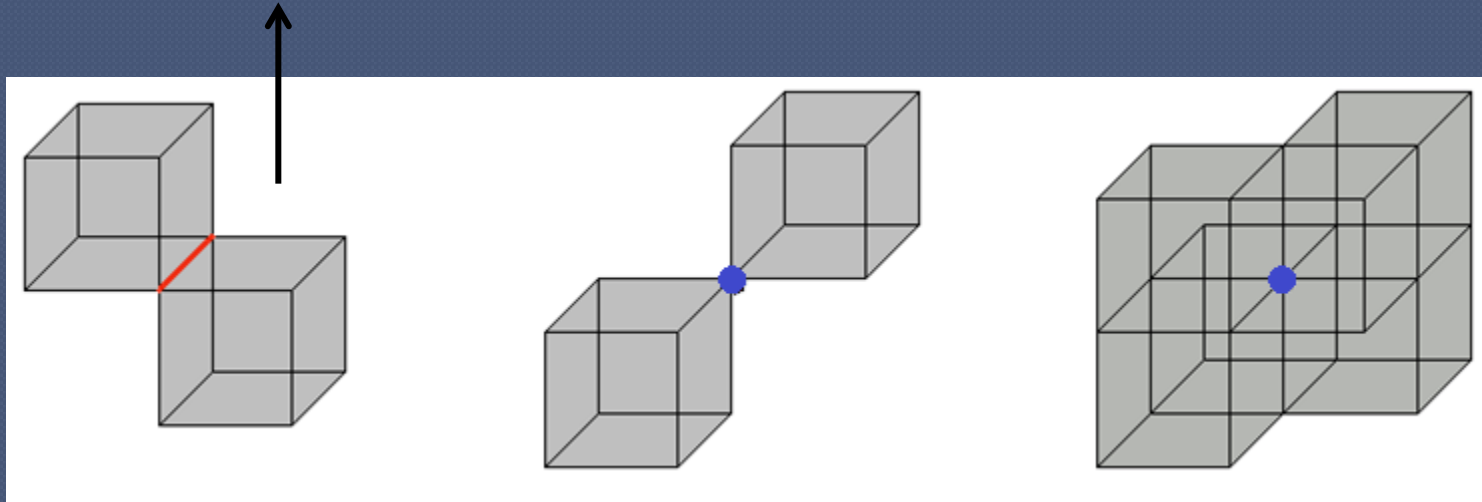

# Well-composed images:

This point has not a neighborhood homeomorphic to  $\mathbb{R}^2$ .

# Well-composed images:

Critical configurations within a block of eight cubes

# From a cubical complex to a well-composed cell complex:

---

A 3D digital image is not generally a well-composed image

Cubical complex  $Q(I)$

Homotopy equivalent

Cell complex  $K(I)$  such that  $\partial K(I)$  is composed by 2D-manifolds: a *well-composed cell complex*.

# From a cubical complex to a well-composed cell complex:

**Key idea:** to create a true face adjacency to avoid the critical configurations

Cubical complex  $Q(I)$

Homotopy equivalent

Cell complex  $K(I)$  such that  $\partial K(I)$  is composed by 2D-manifolds: a *well-composed cell complex*.

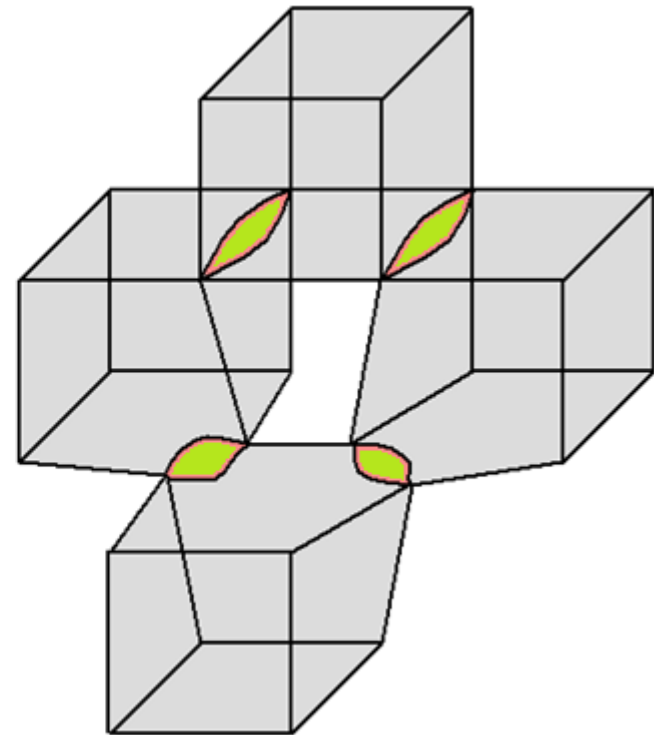

# From a cubical complex to a well-composed cell complex:

INPUT

Cubical complex  $Q(I)$

OUTPUT

Well-composed cell complex  $K(I)$

# From a cubical complex to a well-composed cell complex:

So, we need “more space” to add new cells:

Adjacency =  
face relation  
between cells.

# From a cubical complex to a well-composed cell complex:

Step 1: Label critical edges and critical vertices of  $Q(I)$ .

Step 2: Repair critical edges of  $Q(I)$ .

Step 3: Repair critical vertices of  $Q(I)$ .

Cubical complex  $Q(I)$

Homotopy equivalent

Cell complex  $K(I)$  such that  $\partial K(I)$  is composed by 2D-manifolds: a *well-composed cell complex*.

# From a cubical complex to a well-composed cell complex:

Step 1: Label critical edges and critical vertices of  $Q(I)$ .

$A :=$  set of critical edges of  $Q(I)$

$V^i :=$  set of critical vertices of  $Q(I)$

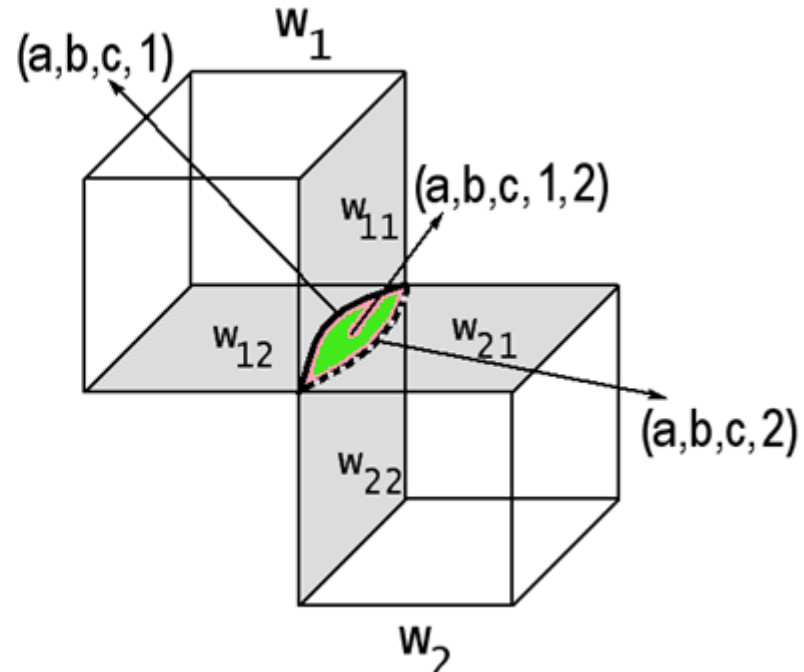

# From a cubical complex to a well-composed cell complex:

Step 1: Label critical edges and critical vertices of  $Q(I)$ .

Step 2: Repair critical edges of  $Q(I)$ .

# Computing well-composed cell complexes

Step 1: Label critical edges and vertices.

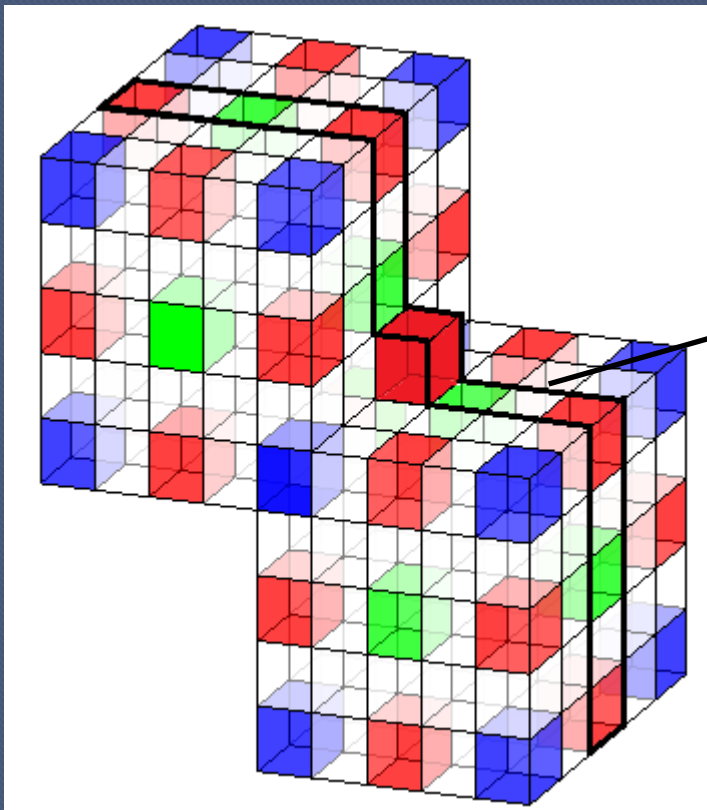

Step 2: Repair critical edges of  $Q(I)$ .

# Computing well-composed cell complexes efficiently

Step 1: Label critical edges and vertices.

Step 2: Repair critical edges of  $Q(I)$ .

Adjacency = face relation between cells.

U

# From a cubical complex to a well-composed cell complex:

Step 1: Label critical edges and critical vertices of  $Q(I)$ .

Step 2: Repair critical edges of  $Q(I)$ .

Step 3: Repair critical vertices of  $Q(I)$ .

Example 1

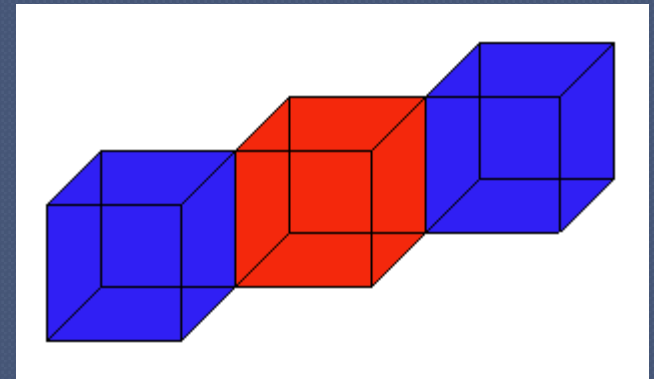

# Computing well-composed cell complexes

Step 1: Label critical edges and critical vertices of  $Q(I)$ .

Step 2: Repair critical edges of  $Q(I)$ .

Step 3: Repair critical vertices of  $Q(I)$ .

Example 1

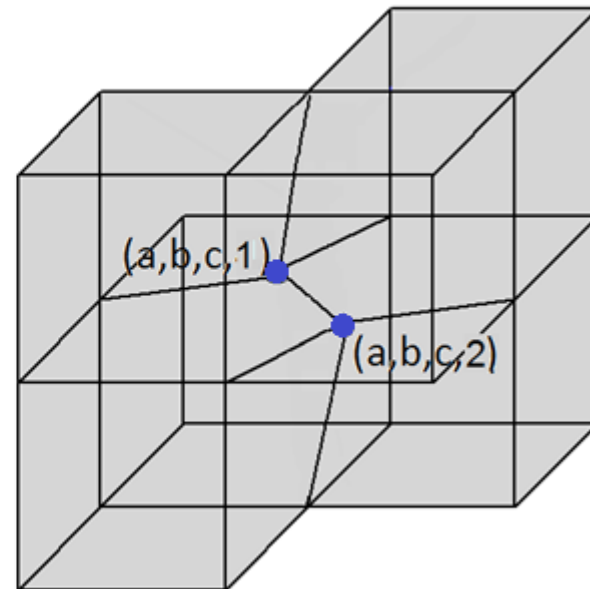

# From a cubical complex to a well-composed cell complex:

Step 1: Label critical edges and critical vertices of  $Q(I)$ .

Step 2: Repair critical edges of  $Q(I)$ .

Step 3: Repair critical vertices of  $Q(I)$ .

Example 2

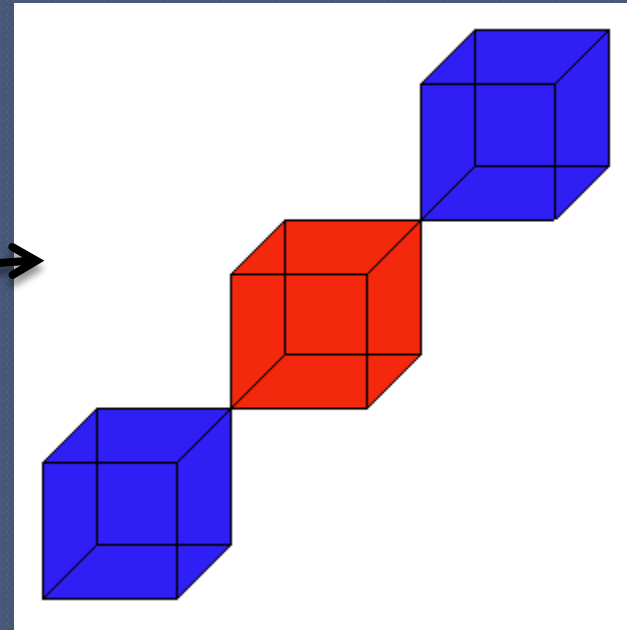

# Computing well-composed cell complexes

Step 1: Label critical edges and critical vertices of  $Q(I)$ .

Step 2: Repair critical edges of  $Q(I)$ .

Step 3: Repair critical vertices of  $Q(I)$ .

Example 2

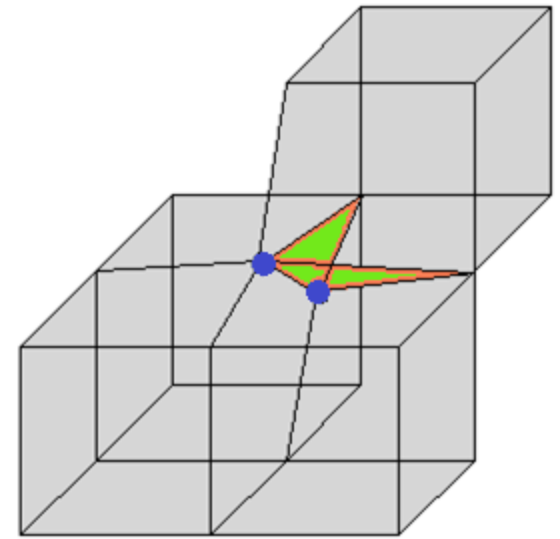

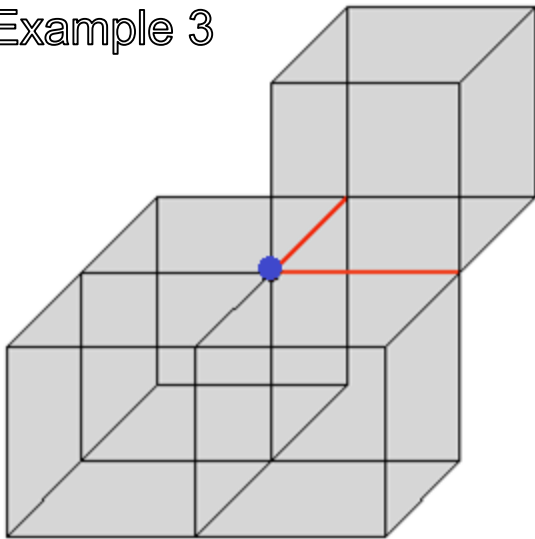

# From a cubical complex to a well-composed cell complex:

Step 1: Label critical edges and critical vertices of  $Q(I)$ .

Step 2: Repair critical edges of  $Q(I)$ .

Step 3: Repair critical vertices of  $Q(I)$ .

Example 3

# From a cubical complex to a well-composed cell complex:

Step 1: Label critical edges and critical vertices of  $Q(I)$ .

Step 2: Repair critical edges of  $Q(I)$ .

Step 3: Repair critical vertices of  $Q(I)$ .

Example 3

# Future work:

---

## Aims:

- ❑ To compute the homology of the foreground image as well as the background by computing the homology of the boundary surface;
- ❑ Geometrically control the representative (co)-cycles of homology generators;
- ❑ Deal with other 3D digital images: (6,26), (18,6) or (6,18) 3D images.

# Thanks for your attention!
